

Jitsi

Just some notes for me, but may be useful for others.

Jitsi is a video bridge server. It allows two or more users to do video chat. It uses Prosody for an XMPP chat also, and appears to use Prosody for authentication.

Quick Notes

Location of authentication files

User authentication file (plain text, so don't trust it)

```
/var/lib/prosody/server%2ename%2edomain/accounts
```

Basically, the server name with the dots replaced with %2e

Create a new user

Done via prosody, using the prosodyctl command.

```
prosodyctl register <username> <server.example.com> <password>
```

replace <username> and <password> with information. Replace <server.example.com> with the (jitsi) name of the server.
