sysinfo-client installation

Though it can be installed on any Linux/Unix system manually. Instructions are:

1. Download and uncompress current version
2. Create a directory for the executables (I call it bindir here). Suggestions are:
    1. FreeBSD - /usr/local/opt/camp/sysinfo-client
    2. Linux - /opt/camp/sysinfo-client
3. Create a directory for the configuration file(s) (I call it confdir here)
    1. FreeBSD - /usr/local/etc/camp/sysinfo-client
    2. Linux - /etc/camp/sysinfo-client
4. move everything into the bindir
5. copy sysinfo-client.conf.template to confdir/sysinfo-client.conf
6. edit sysinfo-client.conf. the script configure.pl can help with it, but it is definitely not foolproof. You will need at least one transport (see bindir/scripts)
7. Run sysinfo-client as
